Terrace Oasis: a city that grows its own shade beside the first fields　台地绿洲：在第一片农光田旁长出树荫的城市

Summary

Reference example, not an entry. The first city stands on the flat terrace directly east of the lead zone, between the fields and a 30 m bluff, facing the Andes. About 41,340 people live in low courtyard houses on a 300 m grid; every street is an acequia street, shaded by trees watered by gravity from a tank on the bluff; machines keep to their own 600 m grid. Across the site, four oasis cities hang on one corridor, the Line, from the RN 20 gate to the port in the east. The city gives up growth speed, not water.

Declared trade-off

Growth speed: the city does not grow faster than its measured water allows. Why: Nobody knows the aquifer's recharge. A city sized on hope is the one irreversible mistake a desert city can make.. Who bears it: The developer and investors, through slower returns, and households on the waiting list; not the aquifer and not the people already living here.
