AGUA FINITA | The Finite Water City　有限水城

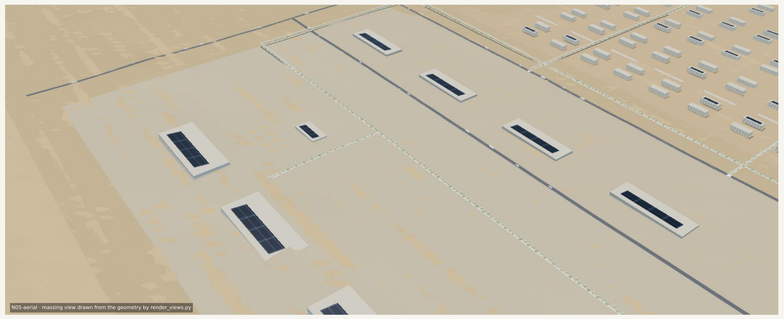

Summary

A compact first settlement east of the fixed agrivoltaic pilot gives water, shade and human services priority over uninterrupted compute. Dry channels stay open; a public water ledger controls growth. Three nodes connect dry cooling, a seasonal wash and a shaded civic commons.

Declared trade-off

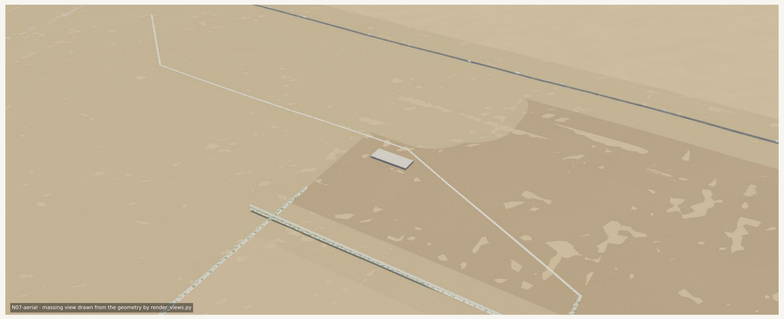

Maximum uninterrupted compute throughput and minimum cooling electricity. Why: Scarce water is reserved first for people and the existing agricultural system.. Who bears it: Compute investors and customers accept interruption contracts; tenants are protected by reserved service funding, while workers need paid reassignment during curtailment.

N05 A compute campus and its waste heat

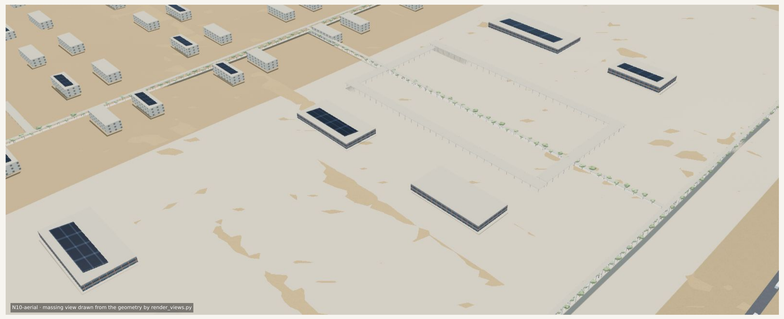

N07 A seasonal river park

N10 Public space in heat and Zonda wind
